# Solución de ejercicios del taller

Funciones almacenadas en MYSQL

Por ING Lilliana Uribe

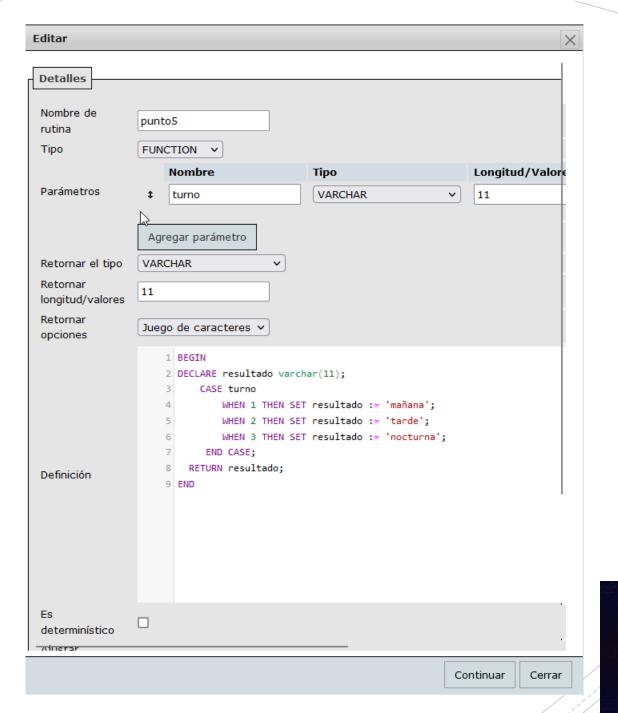

## Creación

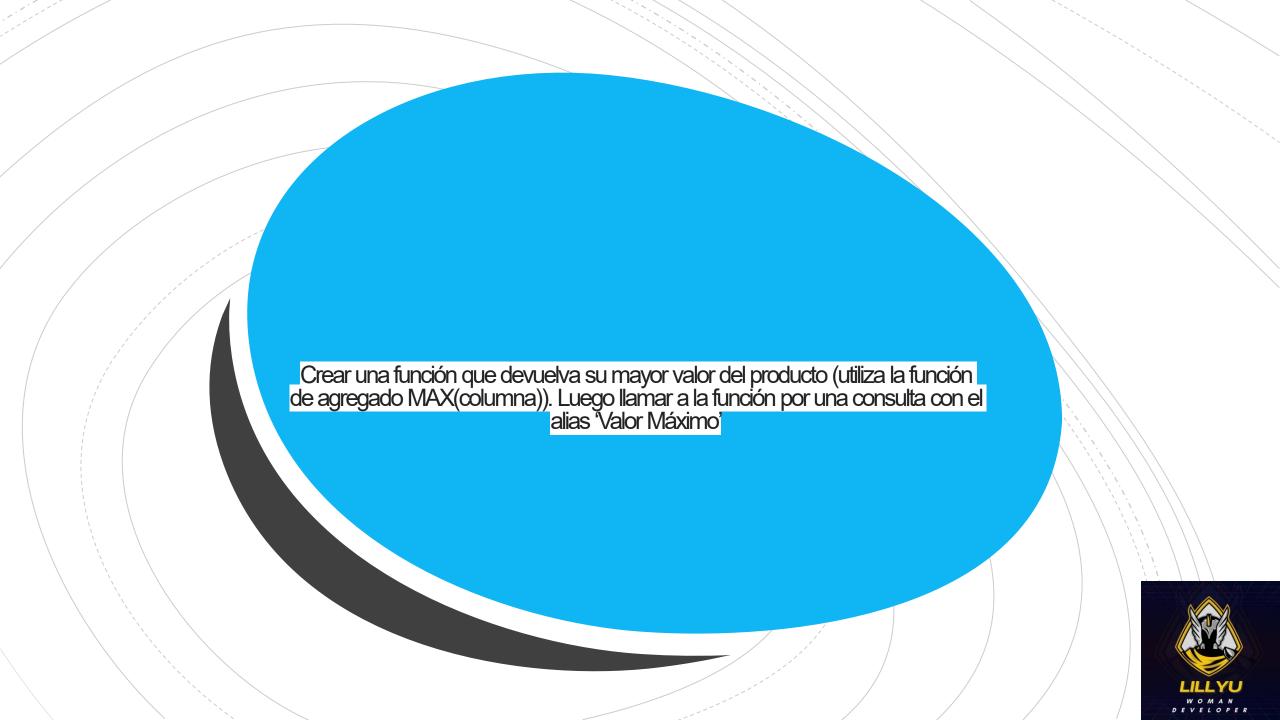

- DELIMITER \$\$
- CREATE DEFINER=`root`@`localhost` FUNCTION
   `punto5`(turno VARCHAR(11)) RETURNS varchar(11)
   CHARSET utf8 COLLATE utf8\_general\_ci
- BEGIN
- DECLARE resultado varchar(11);
- CASE turno
- WHEN 1 THEN SET resultado := 'mañana';
- WHEN 2 THEN SET resultado := 'tarde';
- WHEN 3 THEN SET resultado := 'nocturna';
- END CASE;
- RETURN resultado;
- END\$\$
- DELIMITER;

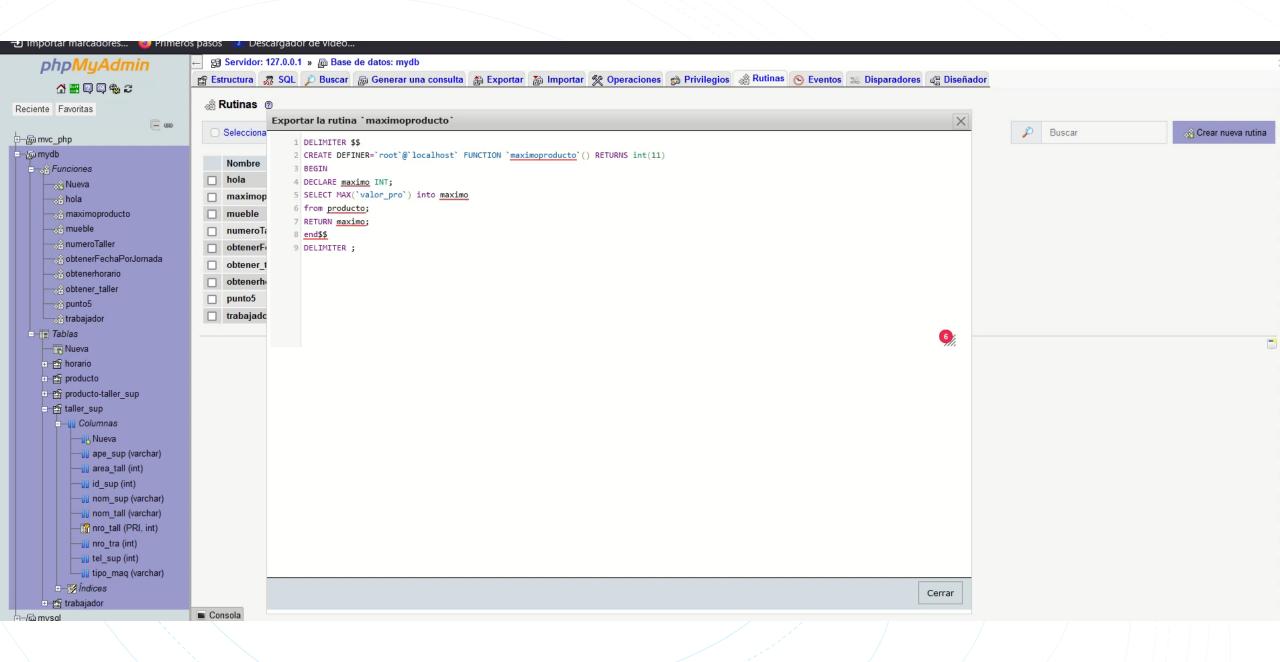

# Creación de la función

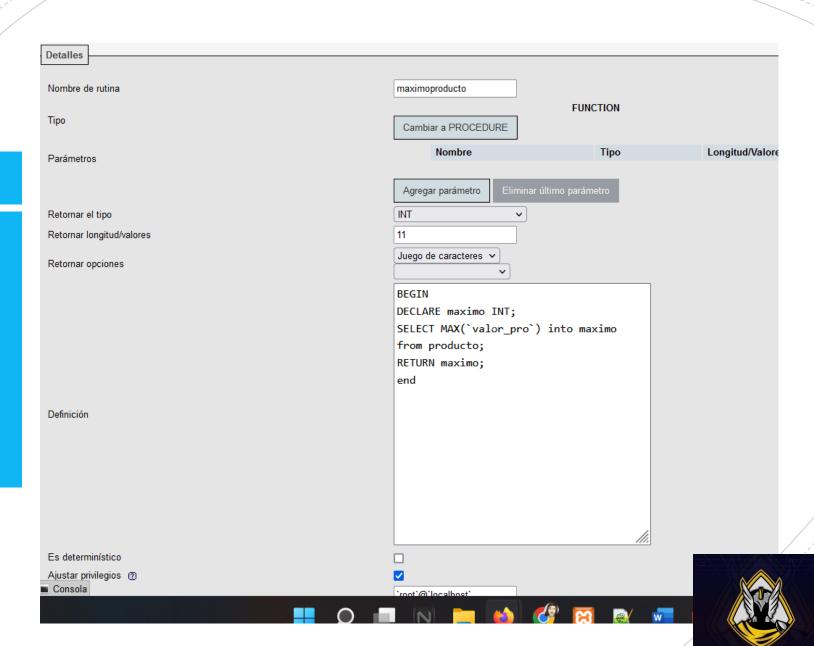

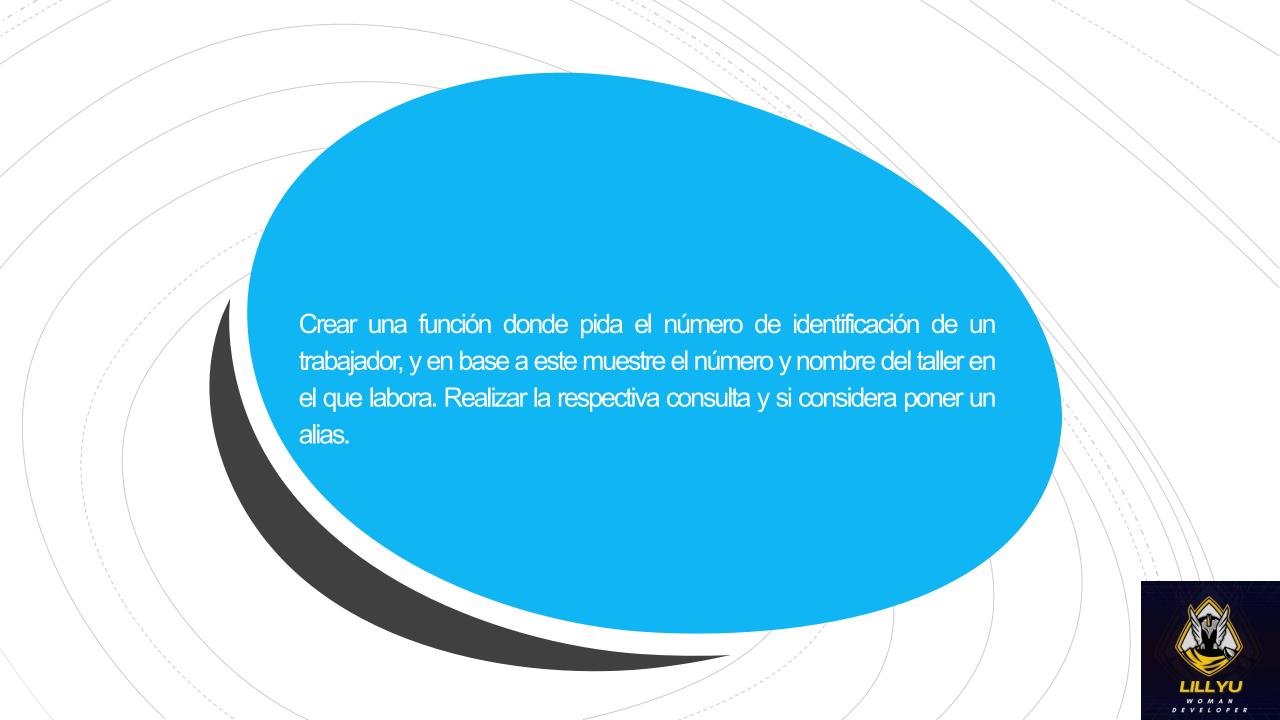

# Creación

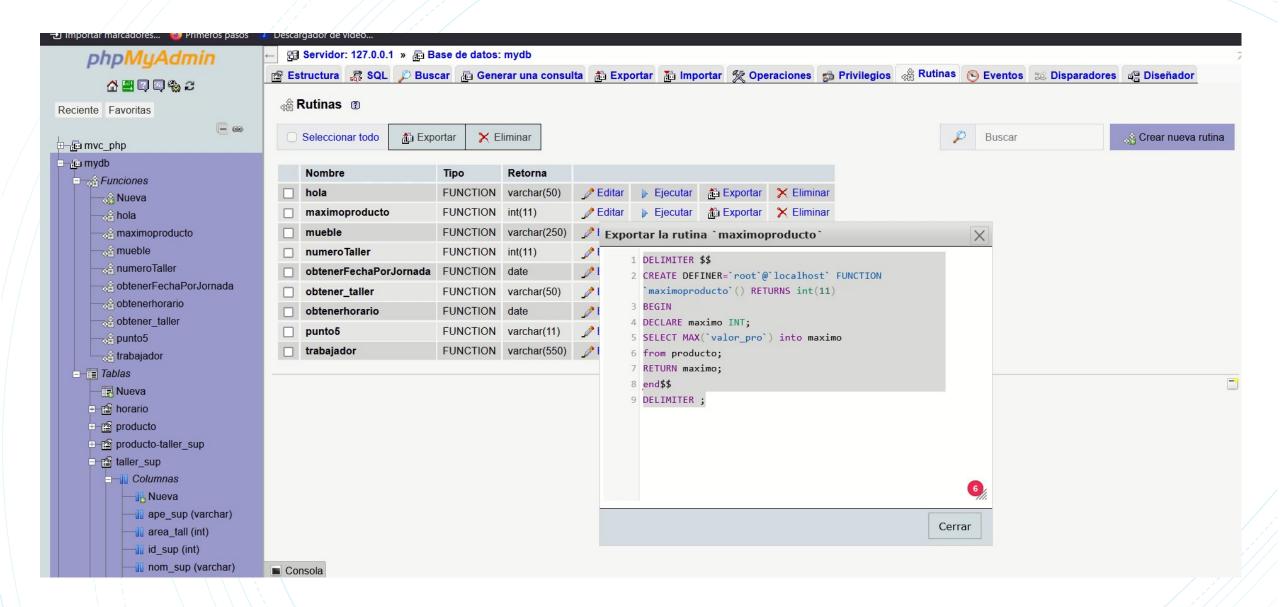

- DELIMITER \$\$
- CREATE DEFINER=`root`@`localhost` FUNCTION
   `maximoproducto`() RETURNS int(11)
- BEGIN
- DECLARE maximo INT;
- SELECT MAX(`valor\_pro`) into maximo
- from producto;
- RETURN maximo;
- end\$\$
- DELIMITER;

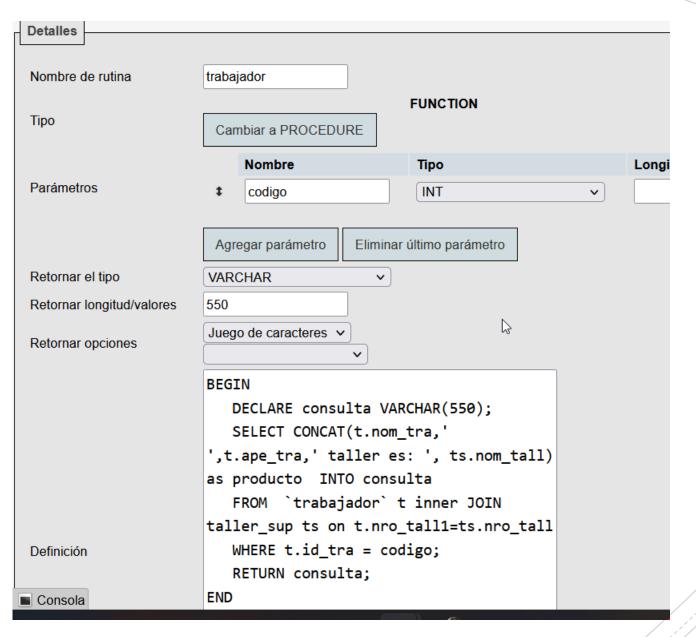

DEVELOPER

### create

```
DELIMITER $$
CREATE DEFINER=`root`@`localhost` FUNCTION
`trabajador`(`codigo` INT) RETURNS varchar(550)
CHARSET utf8 COLLATE utf8_general_ci
BEGIN
 DECLARE consulta VARCHAR(550);
 SELECT CONCAT(t.nom_tra,' ',t.ape_tra,' taller es: ',
ts.nom_tall) as producto INTO consulta
 FROM 'trabajador' t inner JOIN taller_sup ts on
t.nro_talll=ts.nro_tall
 WHERE t.id_tra = codigo;
 RETURN consulta;
END$$
DELIMITER;
```

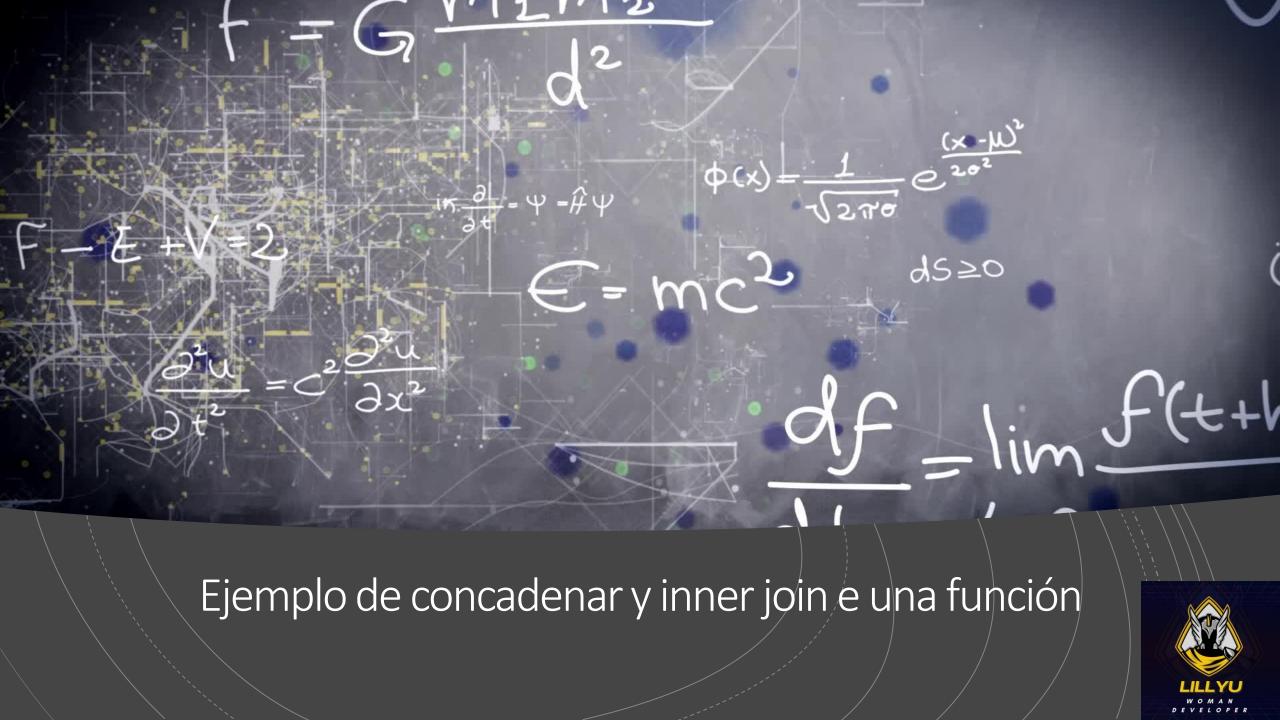

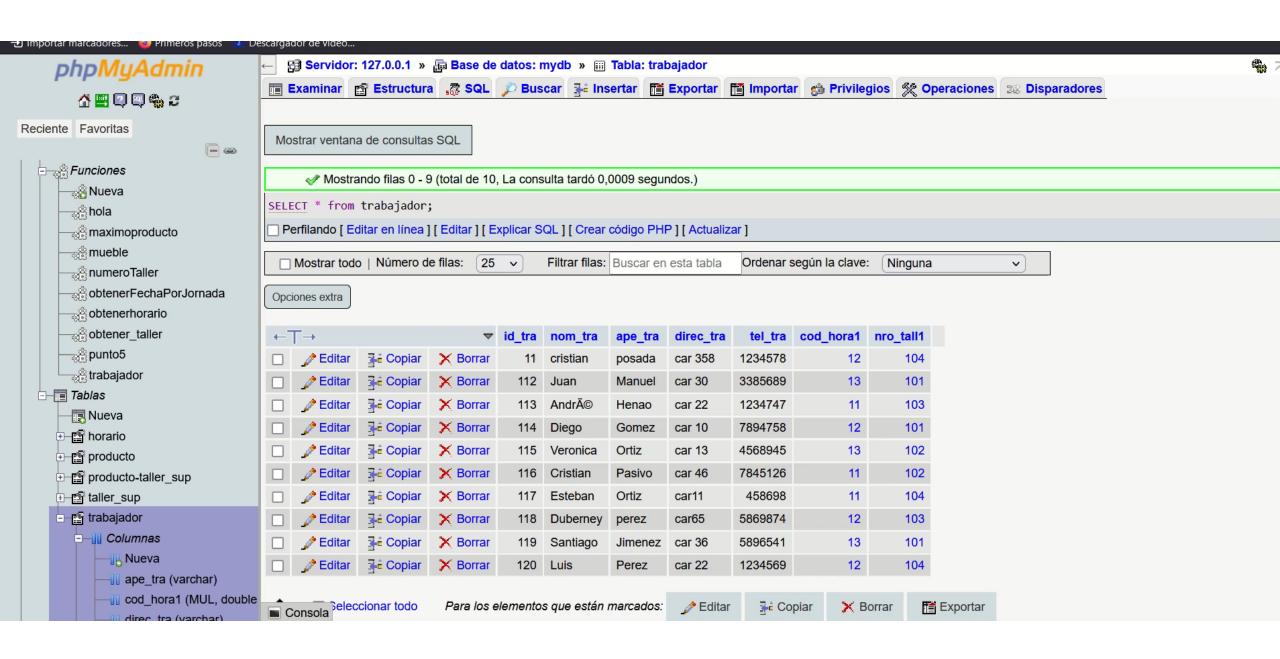

Otra forma de ejécutar

<u>SELECT</u> nom\_tra, ape\_tra, obtener\_taller(trabajador.nro\_tall1) as taller from trabajador;

Mi cara cuando dice que no entiende el ultimo día de entregar un trabajo
